

Pry Bar Aluminium, demolition

This demolition bar combines the best features of both a pry bar and a wrecking bar. The claw with a nail puller makes it an excellent alternative to a wrecking bar. The long handle gives you more power and better range. The length also makes it easier to work with a more ergonomic posture compared to working with a shorter wrecking bar. The handle is hollow and made of specially alloyed aluminium making it light weight and strong at the same time. The low weight compared to steel pry bars and Burke bars makes it more gentle on the body, which is especially important when working above shoulder height. The claw, made from hardened boron steel, is broad and robust but still thin for the best possible access. The curvature of the claw and the heel allow you to work at a comfortable position and you don't have to pry with the handle pushed all the way down to the ground.

Features

- Wide claw with nail puller, in hardened, high-alloy boron steel.
- Handle made from extremely strong aerospace-grade aluminium.
- Aluminium does not rust and withstands cold temperatures better.
- The claw and heel is optimised for ergonomic and efficient work.
